Problem Set #4

Name: _____

Elle and Chad are considering two mutually exclusive risky investments, 1 and 2, with payoffs given by:

$$W_{1,s} = \begin{cases} \$20 & \text{with probability } 20\% \\ \$60 & \text{with probability } 50\% \\ \$100 & \text{with probability } 30\% \end{cases} \quad \text{and} \quad W_{2,s} = \begin{cases} \$40 & \text{with probability } 55\% \\ \$80 & \text{with probability } 45\% \end{cases}$$

Suppose Elle and Chad each have initial wealth $W_0 = \$0$. However, Elle's utility $U(W) = W^5$, whereas Chad's utility $U(W) = \ln W$.

- A. Calculate Elle's expected utility ($E(U(W))$) for both investments.

- B. Calculate Chad's expected utility ($E(U(W))$) for both investments.

- C. Does either investment first order stochastically dominate the other? Explain why or why not.

- D. Compare these investments once again. Is there second order stochastic dominance? Explain why or why not.

- E. Which investment should Elle choose? Explain why.

- F. Which investment should Chad choose? Explain why.
